

```
let result = "5" - 2;

// JavaScript automatically changes "5" from a string to a number.
console.log("The result is: " + result);

// Convert the string "false" into the Boolean value false.
let isValid = false;

if (isValid) {
    console.log("This is valid!");
}

// Convert the string "25" into a number before adding 5.
let age = "25";
let totalAge = Number(age) + 5;

console.log("Total Age: " + totalAge);

// PART 2: My Own Examples

// Implicit conversion
let number = 5;
let text = "10";

console.log("Before implicit conversion:", typeof number);
console.log("Result:", number + text);

// Explicit conversion
let myAge = "20";

console.log("Before explicit conversion:", typeof myAge);

myAge = Number(myAge);

console.log("After explicit conversion:", typeof myAge);
console.log("My age is:", myAge);

// Edge case: NaN
let something = "hello";
let convertedNumber = Number(something);

console.log("Converting hello to a number gives:", convertedNumber);
```
